Network Programming Project 4 - SOCKS4

NP TA

Deadline: Monday, 2019/1/6 23:59

1 Introduction

In this project, you are going to implement the **SOCKS4 protocol** in the application layer of the OSI model.

SOCKS is similar to a proxy (i.e. intermediary-program) that acts as both server and client for the purpose of making request on behalf of other clients. Because the SOCKS protocol is independent of application protocols, it can be used for many different services: telnet, ftp, www, etc.

There are two types of the SOCKS operations (i.e. CONNECT and BIND). You have to implement both of them.

2 SOCKS4 Implementation

SOCKS server starts listening, if a SOCKS client connects, use fork() to tackle with it. Each child process will do:

- 1. Receive SOCKS4_REQUEST from SOCKS client
- 2. Get destination ip and port from SOCKS4_REQUEST
- 3. Check firewall(socks.conf), and send SOCKS4_REPLY to SOCKS client if rejected
- 4. Check CD value and choose one of them
 - (a) CONNECT (CD=1)
 - i. Connect to destination
 - ii. Send SOCKS4_REPLY to SOCKS client
 - iii. Start relaying traffic on both directions
 - (b) BIND (CD=2)
 - i. Bind and listen a port
 - ii. Send SOCKS4_REPLY to SOCKS client, tell the listening port
 - iii. (SOCKS client tells destination to connect to SOCKS server)
 - iv. Accept connection from destination and send SOCKS4_REPLY to SOCKS client again
 - v. Start relaying traffic on both directions

If SOCKS server decides to reject a SOCKS client, the connection will be disconnected immediately.

```
SOCKS4_REQUEST packet (VN=4, CD=1 or 2)
Type 1:
    +---+---+---+
                    DSTIP
                             | VN | CD | DSTPORT |
                                 USERID
    +---+---+....+---+
bytes: 1 1
                       4
                                 variable
Type 2:
    +---+---+---+---+---+---+---+---+---+---+---+....+----+---+---+....+----+
    | VN | CD | DSTPORT | DSTIP(0.0.0.x) | USERID
                                       |NULL| DOMAIN NAME |NULL|
    +---+---+---+---+---+---+---+---+---+---+....+----+
             2
                       4
                                 variable 1 variable 1
bytes: 1 1
e.g.
DSTIP=140.113.1.2
DSPPORT=1234 (hint: 1234 = 4*256 + 210 = DSTPORT[0]*256 + DSTPORT[1])
USERID=MOZ
    +---+---+---+---+
    | 4 | 1 | 4 | 210 | 140 | 113 | 1 | 2 | M | 0 | Z |
    +---+
                4
                              - 1
bytes: 1 | 1 |
             2
                                 variable | 1
SOCKS4_REPLY packet (VN=0, CD=90(accepted) or 91(rejected or failed))
    +---+
    | VN | CD | DSTPORT |
                      DSTIP
    +---+
             2
bytes: 1
        1
```

Please refer to these webpages for more detailed SOCKS4 specification.

SOCKS4

SOCKS4A

3 Requirements

- Part I: SOCKS4 Server Connect Mode
 - Open your browser and connect to any webpages.
 - Turn on and set your SOCKS server, then
 - * Be able to connect any webpages on Google search.
 - * Your SOCKS server need to show messages below:

<S_IP>: source ip <S_PORT>: source port <D_IP>: destination ip <D_PORT>: destination port <Command>: CONNECT or BIND <Reply>: Accept or Reject

- Part II: SOCKS4 Server Bind Mode
 - FlashFXP settings:
 - * Set your SOCKS server
 - * Connection type is FTP
 - * Data connection mode is Active Mode(PORT)
 - Connect to ftp server, and upload/download file bigger than 1GB.
 e.g. Ubuntu 18.04 iso (download link)
 - * Upload file and download file.
 - * Check whether SOCKS server's output has used BIND mode.
- Part III: CGI Proxy
 - Modify console.cgi in Project 3 to implement SOCKS client operation
 - * Accept SocksIP and SocksPort parameter in QUERY_STRING, as sh and sp
 - * Use SocksIP and SocksPort to connect to your SOCKS server(by CONNECT mode)
 - * Rename console.cgi to hw4.cgi in Makefile
 - Clear browser's proxy setting

Open your http server, connect to panel_socks.cgi

Key in IP, port, filename, SocksIP, SocksPort

Connect to 5 ras/rwg servers through SOCKS server and check the output Test Case (same as Project 3, no hidden test case) t1.txt-t5.txt

• Firewall

 You only need to implement a simple firewall. Write permitted IPs into socks.conf (deny all traffic by default)

```
e.g.

permit c 140.114.*.*  # permit NTHU IP (connect mode)

permit c 140.113.*.*  # permit NCTU IP (connect mode)

permit b *.*.*.*  # permit all IP (bind mode)
```

- Be able to change firewall rules without restarting SOCKS server.

4 About Submission

1. E3

- (a) Create a directory named your student ID, put your files in the same directory layer.
- (b) You must provide a Makefile, which compiles your source code into two executables named hw4.cgi(modified from Project 3) and socks_server. The executables should be under the same directory as the source codes. We will use these executables for demo.
- (c) Upload only your code and Makefile. (e.g. console.cpp, socks_server.cpp...)

 Do not upload anything else (e.g. http_server.cpp, panel_socks.cgi...)
- (d) **zip** the directory and upload the .zip file to the E3 platform **Attention!!** we only accept .zip format

2. Bitbucket:

(a) Create a **private** repository: \${your_student_ID}_np_project4 inside the **nctu_np_2019** team, under **np_project4**.

Set the ownership to nctu_np_2019

```
e.g. 0756000_np_project4
```

- (b) For each project, you need to commit on bitbucket for at least 5 times.
- (c) You can push anything you need onto bitbucket as long as the size of the file is reasonable.
- 3. We take plagiarism seriously.

```
All projects will be checked by a cutting-edge plagiarism detector. You will get zero points on this project for plagiarism. Please don't copy-paste any code from the internet, this may be considered plagiarism as well. Protect your code from being stolen.
```
